

# Mead Johnson Nutrition – Water Policy

We know and work diligently to support awareness that the supply of clean, safe water is essential for the proper reconstitution and use of our powdered products.

We acknowledge the importance of the responsible use of water. Both people and companies rely on clean, plentiful water. We must all work to ensure supplies are adequate and quality is assured.

Water conservation has always been a focus area for our production facilities; and since 2009, Mead Johnson has had long-term, global water-use reduction goals in place. Consistent with our overall commitment to environmental responsibility, we operate according to the following principles to ensure that our business helps preserve this vital resource:

1. **Sufficient water:** We strive to operate in a manner that will not diminish community water resources. We consider the availability of water when selecting new business locations, and we seek to achieve efficient use of water resources at all our facilities worldwide. We regularly engage with local communities regarding our water usage and conservation initiatives, and we routinely conduct water audits and implement best practices for water management to help ensure the attainment of conservation targets.
2. **Safe, acceptable and affordable water:** We seek to preserve the quality of our water resources in the communities in which we do business. We consider relevant local and community water standards, and consistently apply our own internal quality standards to our operations worldwide. Additionally, we support community initiatives to provide safe water in adequate supply and affordable within local practices.
3. **Access to water:** We will not knowingly adversely impact the ability of people to access community water resources, and we will address community concerns in a prompt, cooperative and open manner.
